

Software Engineer Intern

Internship Programme 2026 | Bengaluru, India | 6 months

About Us

Falabella India is the first Latin American retail conglomerate to establish a technology and R&D centre in India. Since 2018, we have been building technology capabilities that enable the growth and transformation of Falabella's businesses across Latin America. Built around three pillars, People, Culture, and Technology, our Bengaluru office is home to 350+ innovators working across technology, digital commerce, data, analytics, and other critical capabilities.

Innovation is at the core of what we do. Our teams build solutions across digital commerce, supply chain, Data & Analytics, and AI to create better customer experiences, simplify operations, and enable smarter, more connected businesses. Our growing AI team is exploring and building AI-powered solutions that are shaping the next generation of retail technology.

As part of Falabella Group's Vision 2030, we are working towards a more digital, customer-centric, data-driven, and technology-enabled future. Our Bengaluru teams play an important role in this journey, turning ideas into technology, solving complex business challenges, and building solutions that can scale across markets.

And while technology drives what we build, our people and culture define how we build it. Together, we work as One Team (#SomosUnSoloEquipo), keeping customers at the centre of everything we do and working towards our purpose of Simplifying and Enjoying Life More.

Join Us as a Software Engineer Intern

Falabella India is looking for Software Engineer Interns to join our engineering and data teams. We're looking for curious, driven students and final-year graduates with strong technical fundamentals, hands-on project experience, analytical thinking, and a willingness to learn.

As an intern, you'll work alongside experienced engineers and data professionals on real-world technology challenges that power Falabella's eCommerce and Retail businesses across Latin America. From building customer-facing web and mobile experiences to developing APIs, data pipelines, AI and machine learning solutions, you'll get the opportunity to contribute to products and platforms used at scale.

You'll learn, build, experiment, and solve, while working with teams that are shaping the future of retail technology, digital commerce, data, and AI.

Tracks we are hiring for

- **AI/ML Engineering:** Building, training and deploying machine learning and Generative AI models for personalisation, search relevance, forecasting and conversational experiences.
- **Data Science:** Turning large-scale retail data into insight through statistical analysis, experimentation, modelling and business-facing storytelling.
- **Data Engineering:** Designing and building the pipelines, warehouses and data products that make trusted data available at scale.
- **Full Stack Engineering:** Developing responsive, accessible customer and internal-facing applications end to end, from interface to service layer.
- **Backend Engineering:** Building secure, high-performance APIs, services and integrations that power our retail and eCommerce platforms.

You may apply to a single JD; please indicate your preferred track in your application.
Final allocation will be based on your skills, interests and business requirements.

What will you do?

- Design, build and test software, data pipelines or machine learning models that solve real-world retail and eCommerce problems.
- Write clean, production-quality, well-tested code and participate in code reviews with experienced engineers.
- Work with large-scale retail datasets, exploration, cleaning, transformation and modelling, to support product, pricing, supply chain and customer experience decisions.
- Contribute to the full delivery lifecycle, requirement discussions, design, development, testing, deployment and monitoring, owning end-to-end responsibility for your work.
- Deploy and support your work on cloud platforms such as GCP, AWS or Azure with a DevOps mindset, version control, CI/CD, observability and troubleshooting.
- Explore how AI and Generative AI tooling can improve our products and your own productivity, and bring those ideas to your team.
- Work in an agile team spread across multiple geographies daily, using collaborative tools like Jira and GitLab.
- Present your work clearly to technical and business stakeholders, and participate in knowledge-sharing sessions to learn/share your knowledge within the organization.

What do you need to have?

- Pursuing or recently completed a degree in Computer Science, Information Technology, Data Science, AI/ML, Mathematics, Statistics, Electronics or a related branch, with a minimum of 60% average across semesters.
- Strong programming proficiency in at least one language, Python, Java, JavaScript/TypeScript, Go or C++, along with familiarity with SQL.
- Solid foundation in Data Structures, Algorithms, Object-Oriented Programming and Database concepts.

- Demonstrable hands-on experience through academic projects, internships, research work, hackathons, competitions or open-source contributions (please share GitHub / portfolio links).
- Working knowledge of version control (Git) and an understanding of software engineering good practices such as testing, debugging and documentation.
- Awareness of cloud and modern development concepts, APIs, containers, CI/CD, and a willingness to learn quickly on the job.
- Strong analytical skills, with a penchant for solving complex, open-ended problems.
- Team player with the ability to communicate with multicultural teams.
- Proactive attitude in identifying problems and providing solutions.
- Curiosity, creativity and innovative thinking are appreciated.

Track-specific skills

You are not expected to have all of the below. Strength in the areas relevant to your preferred track is what matters.

Track	Skills we look for
AI/ML Engineering	Core ML concepts (supervised and unsupervised learning, model evaluation metrics, overfitting and regularisation, neural network fundamentals); hands-on experience with at least one framework such as PyTorch, TensorFlow or scikit-learn; Python with Pandas and NumPy; exposure to LLMs and Generative AI, prompt engineering, RAG pipelines, fine-tuning and evaluation; Linear Algebra, Probability and Statistics.
Data Science	Statistics, exploratory data analysis and feature engineering; Python or R with Pandas, NumPy and scikit-learn; strong SQL; data visualisation and storytelling using tools such as Power BI, Tableau or Looker
Data Engineering	ETL/ELT pipeline design; advanced SQL and data modelling (star/snowflake schemas); Python or Scala; exposure to big data and orchestration tooling such as Spark, Airflow, Kafka, dbt; cloud data warehouses such as BigQuery, Redshift or Snowflake.
Full Stack Engineering	Front-end fundamentals, HTML, CSS, JavaScript/TypeScript, with a framework such as React, Angular or Vue; server-side development using Node.js, Java/Spring Boot or Python; REST API integration; responsive and accessible UI design; relational and NoSQL databases.
Backend Engineering	Server-side development in Java, Python, Go or Node.js; designing and building RESTful APIs and microservices; relational and NoSQL databases with query optimisation; caching, messaging and event-driven basics; understanding of system design, scalability, security and performance.

Nice to have

- Exposure to LLM tooling such as Hugging Face, LangChain or OpenAI/Gemini APIs, and to AI coding assistants like GitHub Copilot and vector databases.
- Published research papers, hackathon wins, competitive programming ranks or personal side projects deployed for real users.
- Contributions to open-source ecosystems or active technical blogging.

Internship details

- Location: Bengaluru, India
- Duration: 6 months
